

BESMA KADDOUR

Full Stack Software Engineer · AI-Assisted Software Engineer

Web & Mobile Applications · Software Systems · Financial Market Analysis

Contact: WhatsApp · Email ·

Professional Summary

Full Stack Software Engineer working across web applications, mobile applications, backend systems, dashboards, digital platforms, AI-assisted development, automation, and financial market analysis software. Works across requirements, architecture, UI/UX implementation, frontend and backend development, database design, REST APIs, authentication, third-party integrations, testing, debugging, deployment, production maintenance, and performance optimization.

AI is used as an engineering tool for codebase analysis, code generation and review, debugging, refactoring, testing, documentation, technical investigation, and development automation. Engineering judgment, validation, and production integration remain central to the workflow.

Core Engineering Expertise

- Full-stack, frontend, and backend architecture
- Responsive web applications, dashboards, APIs, and digital platforms
- Mobile and cross-platform development for Android and iOS
- Database architecture, data modeling, query optimization, and API integration
- Authentication and security-conscious development
- Cloud deployment, environment configuration, and production maintenance
- Automated, integration, regression, and build validation
- Systematic debugging across network, authentication, database, mobile, and production environments
- Refactoring, version control, software maintenance, and performance optimization

AI, Agents & Automation

Practical AI-assisted software engineering for architecture analysis, code generation, code review, debugging, refactoring, testing, documentation, problem solving, multi-file changes, and development automation. Experience areas include AI applications, conversational interfaces, AI agents, and intelligent automation workflows. Tools and working patterns include Claude Code, OpenCode, AI coding agents, engineering review, validation, and production integration.

Financial Markets & Trading Technology

Software engineering related to financial market analysis and market-data systems, including Forex, gold/XAUUSD, silver, major market indices, DXY, technical analysis, fundamental analysis, price action, market

structure, sessions, volatility, liquidity, economic news, macroeconomic conditions, external market data, and multi-factor signal analysis.

Trading-technology architecture includes market-data processing, analysis workflows, decision logic, execution logic, pending-order logic, entry validation, risk-management components, dynamic Stop Loss / Take Profit logic, profit protection, drawdown protection, exposure monitoring, margin monitoring, position management, news filtering, and market-session analysis.

Professional Experience

Software Engineer / Digital Identity

2024 — Present · Six years of experience stated by the profile owner

A professional practice across full-stack software engineering, AI-assisted development, software architecture, digital products, mobile and web applications, financial technology, automation, and creative technology.

- Build and maintain web applications, mobile applications, backend systems, dashboards, APIs, and digital platforms.
- Work across requirements, architecture, implementation, integration, testing, debugging, deployment, and production maintenance.
- Develop AI-powered applications and practical AI-assisted engineering workflows.
- Design software for market analysis, automated trading, decision logic, execution, position management, and risk-management systems.
- Investigate existing codebases, implement multi-file changes, refactor systems, and validate production behavior.

Projects & Technical Experience

The following projects and experience areas are included from the supplied profile. No unverified client names, dates, links, or performance claims have been added.

- **Smart Home:** Research and development work in connected-home concepts and automation.
- **Smart Door Lock:** A magnetic-card access-control project.
- **Android application:** An Android application published on Amazon.
- **Modern computer mice:** A computer-hardware project.
- **Glasses for the blind:** An assistive-technology project.
- **Android and iOS applications:** Two mobile applications for Android and iOS.
- **Applications and computer programs:** Software development across application and desktop-program concepts.
- **Research in Physics & Electronics:** Technical research and practical electronics work.
- **Financial market systems:** Software concepts for Forex technical and fundamental analysis, market data, and trading technology.

Technical Skills

Programming Languages

TypeScript, JavaScript, Python, Java, Kotlin, PHP, HTML5, CSS3, and Arduino.

Web Development

React, Next.js, responsive interfaces, component architecture, dashboards, API integration, authentication, real-time interfaces, performance, and modern frontend architecture.

Backend & Software Development

Node.js, Python, PHP, Laravel, REST APIs, authentication, database-driven applications, business logic, external API integrations, production APIs, cloud services, and computer programs.

Mobile Development

Flutter, React Native, Android, Kotlin, Java, Capacitor, iOS integration, WebView-based architectures, native bridges, API connectivity, authentication, network handling, mobile UI, and production builds.

Databases

PostgreSQL, MySQL, MongoDB, Firebase, database architecture, data modeling, API/database integration, query optimization, and production data handling.

Cloud, DevOps & Tools

Git, GitHub, npm, Gradle, Android Studio, Xcode, Vercel, Render, terminal-based development workflows, environment configuration, production deployments, API deployment, and frontend/backend integration.

Platforms & Integrations

Telegram Mini Apps, WebView applications, native mobile integration, third-party APIs, authentication systems, real-time systems, and cloud services.

Testing, Debugging & Validation

Automated testing, API testing, integration testing, regression testing, production troubleshooting, build troubleshooting, network debugging, authentication debugging, database debugging, mobile debugging, deployment validation, systematic debugging, and verification before production integration.

Certifications & Training

NASA International Space Apps Challenge

GALACTIC PROBLEM SOLVER — certificate presented to **basma Kaddour** for outstanding participation in efforts to address challenges facing Earth and space. **Date shown on certificate: October 5–6, 2024.**

Additional verified learning listed in the supplied profile includes certificates or courses in **Kotlin, Python, Java, and Arduino**. No institution, credential title, or date has been added where it was not provided.

Education

Research in Physics & Electronics is included from the supplied profile. University, institution, degree, and dates were not provided and are therefore not invented.

Languages

Arabic and English.
